

CHAPTER: Heat Transfer - SYNTHETIC DEMO 48

Definition: Heat transfer is energy moving because of a temperature difference.

Fact: Conduction transfers heat through direct contact in this example.

Explanation: Energy moves from a warmer region toward a cooler region.

Example: A metal spoon warms by conduction in hot water.

Activity: Compare heat transfer through two safe material samples.

Question: Which heat process occurs through direct contact?

Solution: The described heat process is conduction.
