

CHAPTER: Fractions as Equal Parts - SYNTHETIC DEMO 57

Definition: A fraction describes selected equal parts of a whole.

Explanation: In a fraction, the denominator counts all equal parts.

Formula: $\text{fraction} = \text{selected equal parts} / \text{all equal parts}$.

Example: Three selected parts out of four equal parts form $3/4$.

Activity: Fold a strip into equal parts and label one fraction.

Question: Which fraction names one selected part out of four?

Solution: One selected part out of four is the fraction $\frac{1}{4}$.
